Outline

History

 $\mathrm{PSL}(2,\mathbb{C})$ A-polynomial

Mahler measure

Bloch-Wigner dilogarithm

Mahler measure of $\overline{A}_0(\ell, m)$

Examples

・ロト ・雪ト ・雪ト ・雪ト ・白ト

History

In 2000 David Boyd observed (numerically) that the two-variable Mahler measure of A-polynomials were equal to sums of hyperbolic volumes. In many cases it was equal to the volume.

In 2003 Boyd and Rodrigues-Villegas explained this observation and gave a technique to compute the Mahler measures of (tempered) two-variable polynomials.

In this talk I will explain:

- How this technique works for A-polynomials.
- Why A-polynomials are natural examples which work.

Ideal Triangulations

An *ideal tetrahedron* is a geodesic tetrahedron in hyperbolic 3-space \mathbb{H}^3 with all its four vertices on the sphere at infinity.

Every edge gets a complex number called the *edge parameter*. Isometry classes $\leftrightarrow \{z \in \mathbb{C} | \operatorname{Im}(z) > 0\}$. An ideal tetrahedron with edge parameter z is denoted by $\Delta(z)$.

An *ideal triangulation* of a cusped hyperbolic 3-manifold N is a decomposition into hyperbolic ideal tetrahedra.

Ideal Triangulations

An *ideal tetrahedron* is a geodesic tetrahedron in hyperbolic 3-space \mathbb{H}^3 with all its four vertices on the sphere at infinity.

Every edge gets a complex number called the *edge parameter*. Isometry classes $\leftrightarrow \{z \in \mathbb{C} | \operatorname{Im}(z) > 0\}$. An ideal tetrahedron with edge parameter z is denoted by $\triangle(z)$.

An *ideal triangulation* of a cusped hyperbolic 3-manifold N is a decomposition into hyperbolic ideal tetrahedra.

Ideal Triangulations

An *ideal tetrahedron* is a geodesic tetrahedron in hyperbolic 3-space \mathbb{H}^3 with all its four vertices on the sphere at infinity.

Every edge gets a complex number called the *edge parameter*. Isometry classes $\leftrightarrow \{z \in \mathbb{C} | \operatorname{Im}(z) > 0\}$. An ideal tetrahedron with edge parameter z is denoted by $\triangle(z)$.

An *ideal triangulation* of a cusped hyperbolic 3-manifold N is a decomposition into hyperbolic ideal tetrahedra.

Let N be one-cusped hyperbolic 3-manifold triangulated with n tetrahedra.

• At every edge the tetrahedra close up and their parameters multiply to 1. This gives **gluing equations**: $\prod_{i=1}^{n} z_{i}^{r_{ij}'} (1 - z_{i})^{r_{ij}''} = \pm 1, j = 1, \dots n.$

• The cusp torus gives **completeness equations:**

$$\ell(\mathbf{z}) = \prod_{i=1}^{n} z_i^{l_i'} (1 - z_i)^{l_i''} = 1$$
$$m(\mathbf{z}) = \prod_{i=1}^{n} z_i^{m_i'} (1 - z_i)^{m_i''} = 1$$

• $P(N) = \{\mathbf{z} = (z_1, \dots, z_n) \in \mathbb{C}^n | \text{ satisfy gluing equations} \}$ is called the *parameter space* of *N*. $P_0(N)$ is the component containing the complete parameter \mathbf{z}^0 .

i=1

Let N be one-cusped hyperbolic 3-manifold triangulated with n tetrahedra.

• At every edge the tetrahedra close up and their parameters multiply to 1. This gives gluing equations: $\prod_{i}^{n} z_{i}^{r'_{ij}} (1 - z_{i})^{r''_{ij}} = \pm 1, j = 1, \dots n.$

$$\ell(\mathbf{z}) = \prod_{i=1}^{n} z_i^{l_i'} (1 - z_i)^{l_i''} = 1$$
$$m(\mathbf{z}) = \prod_{i=1}^{n} z_i^{m_i'} (1 - z_i)^{m_i''} = 1$$

• $P(N) = \{\mathbf{z} = (z_1, \dots, z_n) \in \mathbb{C}^n | \text{ satisfy gluing equations} \}$ is called the *parameter space* of *N*. $P_0(N)$ is the component containing the complete parameter \mathbf{z}^0 .

Let N be one-cusped hyperbolic 3-manifold triangulated with n tetrahedra.

• At every edge the tetrahedra close up and their parameters multiply to 1. This gives **gluing equations**: $\prod_{i=1}^{n} z_{i}^{r'_{ij}} (1 - z_{i})^{r''_{ij}} = \pm 1, j = 1, \dots n.$

$$\prod_{i=1}^{r_{i}} z_{i}^{r_{i}} (1-z_{i})^{r_{i}} = \pm 1, j = 1, \dots n.$$

• The cusp torus gives completeness equations:

$$\ell(\mathbf{z}) = \prod_{i=1}^{n} z_i^{l_i'} (1 - z_i)^{l_i''} = 1$$
$$m(\mathbf{z}) = \prod_{i=1}^{n} z_i^{m_i'} (1 - z_i)^{m_i''} = 1$$

• $P(N) = \{\mathbf{z} = (z_1, \dots, z_n) \in \mathbb{C}^n | \text{ satisfy gluing equations} \}$ is called the *parameter space* of *N*. $P_0(N)$ is the component containing the complete parameter \mathbf{z}^0 .

Let N be one-cusped hyperbolic 3-manifold triangulated with n tetrahedra.

• At every edge the tetrahedra close up and their parameters multiply to 1. This gives **gluing equations:** $\prod_{i=1}^{n} z_{ij}^{r'_{ij}} (1 - z_{i})^{r''_{ij}} - \pm 1, i - 1, n$

$$\prod_{i=1}^{r_{i}} z_{i}^{r_{i}} (1-z_{i})^{r_{i}} = \pm 1, j = 1, \dots n.$$

• The cusp torus gives completeness equations:

$$\ell(\mathbf{z}) = \prod_{i=1}^{n} z_i^{l_i'} (1 - z_i)^{l_i''} = 1$$
$$m(\mathbf{z}) = \prod_{i=1}^{n} z_i^{m_i'} (1 - z_i)^{m_i''} = 1$$

• $P(N) = \{ \mathbf{z} = (z_1, \dots, z_n) \in \mathbb{C}^n | \text{ satisfy gluing equations} \}$ is called the *parameter space* of *N*. $P_0(N)$ is the component containing the complete parameter \mathbf{z}^0 .

$PSL(2, \mathbb{C})$ A-polynomial

Define $Hol: P_0(N) \to \mathbb{C}^2$ as $Hol(\mathbf{z}) = (\ell(\mathbf{z}), m(\mathbf{z}))$. The image is a curve in \mathbb{C}^2 and let $\overline{A}_0(\ell, m)$ be its defining equation.

Thm (C) $\overline{A}_0(\ell, m)$ is the component of the PSL(2, \mathbb{C}) A-polynomial corresponding to the component containing the complete structure.

For knot complements

$$\overline{A}_0(\ell^2, m^2) = A_0(\ell, m) A_0(-\ell, m)$$

In general all four factors of the $SL(2, \mathbb{C})$ A-polynomial can appear with signs on ℓ and m.

$PSL(2, \mathbb{C})$ A-polynomial

Define $Hol: P_0(N) \to \mathbb{C}^2$ as $Hol(\mathbf{z}) = (\ell(\mathbf{z}), m(\mathbf{z}))$. The image is a curve in \mathbb{C}^2 and let $\overline{A}_0(\ell, m)$ be its defining equation.

Thm (C) $\overline{A}_0(\ell, m)$ is the component of the PSL(2, \mathbb{C}) A-polynomial corresponding to the component containing the complete structure.

$$\overline{A}_0(\ell^2,m^2) = A_0(\ell,m)A_0(-\ell,m)$$

In general all four factors of the $SL(2, \mathbb{C})$ A-polynomial can appear with signs on ℓ and m.

Mahler measure

Let $p(x_1, ..., x_n) \in \mathbb{C}[x_1^{\pm}, ..., x_n^{\pm}]$. The logarithmic **Mahler** measure of p is defined as

$$m(p) = \frac{1}{(2\pi i)^n} \int_{\mathbb{T}^n} \log |p(x_1,\ldots,x_n)| \frac{dx_1}{x_1} \ldots \frac{dx_n}{x_n}$$

•
$$m(p_1 \cdot p_2) = m(p_1) + m(p_2).$$

• Jensen's formula:
$$\frac{1}{2\pi i} \int_{S^1} \log |x - \alpha| \frac{dx}{x} = \log^+ |\alpha|$$

• Let $p(x) = a_0 \prod_{i=1}^n (x - \alpha_i)$. Then $m(p) = \log |a_0| + \sum_{i=1}^n \log^+ |\alpha_i|$,
where $\log^+ |\alpha| = \max\{0, \log |\alpha|\}$.

Let
$$X = P_0(N)$$
 and let $\ell, m, z_i \in F = \mathbb{C}(\widetilde{P_0(N)})$.

Thm(C) In
$$\wedge_{\mathbb{Z}}^{2}(F^{*})$$
, $\ell \wedge m = \sum_{i=1}^{n} z_{i} \wedge (1 - z_{i})$.
 $\implies \eta(\ell, m) = d(\sum_{i=1}^{n} D(z_{i}))$
 $\sum_{i=1}^{n} D(z_{i}) = \operatorname{vol}(N(\mathbf{z}))$

Hence $\eta(\ell, m)$ gives variation of volume under deformation and hence is called the volume form.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

Exactness of $\eta(\ell, m)$ was directly shown by Hodgson and Neumann-Zagier.

Let
$$X = P_0(N)$$
 and let $\ell, m, z_i \in F = \mathbb{C}(\widetilde{P_0(N)})$.

$$\mathbf{Thm}(\mathsf{C}) \ln \wedge_{\mathbb{Z}}^{2}(F^{*}), \ \ell \wedge m = \sum_{i=1}^{n} z_{i} \wedge (1 - z_{i}).$$
$$\implies \eta(\ell, m) = d(\sum_{i=1}^{n} D(z_{i}))$$
$$\sum_{i=1}^{n} D(z_{i}) = \operatorname{vol}(N(\mathbf{z}))$$

Hence $\eta(\ell, m)$ gives variation of volume under deformation and hence is called the volume form.

Mahler measure of $\overline{A}_0(\ell, m)$

Let
$$\gamma_j = \{|m| = 1, |\ell_j| \ge 1\}$$
.
Let each γ_j have c_j components.
Let ω_{ijk}^1 and ω_{ijk}^2 be lifts of the end points of γ_j to $P_0(N)$.

$$m(\overline{A}_{0}(\ell, m)) = \frac{1}{2\pi} \sum_{j=1}^{m} \int_{\gamma_{j}} \eta(\ell_{j}, m)$$
$$= \frac{1}{2\pi} \sum_{j=1}^{m} \sum_{k=1}^{c_{j}} \sum_{i=1}^{n} (D(\omega_{ijk}^{2}) - D(\omega_{ijk}^{2})) - D(\omega_{ijk}^{2}) - D(\omega_{ijk}^{2}) - D(\omega_{ijk}^{2}) - D(\omega_{ijk}^{2}) - D(\omega_{ijk}^{2}))$$

シックシード エー・ボット 中国マート

Mahler measure of $\overline{A}_0(\ell, m)$

Let
$$\gamma_j = \{|m| = 1, |\ell_j| \ge 1\}$$
.
Let each γ_j have c_j components.
Let ω_{ijk}^1 and ω_{ijk}^2 be lifts of the end points of γ_j to $P_0(N)$.

$$\begin{split} m(\overline{A}_{0}(\ell,m)) &= \frac{1}{2\pi} \sum_{j=1}^{m} \int_{\gamma_{j}} \eta(\ell_{j},m) \\ &= \frac{1}{2\pi} \sum_{j=1}^{m} \sum_{k=1}^{c_{j}} \sum_{i=1}^{n} \left(D(\omega_{ijk}^{2}) - D(\omega_{ijk}^{1}) \right) \end{split}$$

Remarks

• Since $\overline{A}_0(1,1) = 0$ and (1,1) corresponds to the complete structure, vol(N) always appears as a summand in above.

• Conjugate lifts of (1, 1) to $P_0(N)$ correspond to different complex embeddings of the invariant trace field of N.

Neumann-Zagier matrices

Let
$$J_{2k} = \begin{pmatrix} 0 & \mathrm{Id}_k \\ -\mathrm{Id}_k & 0 \end{pmatrix}$$
 be the symplectic matrix.

A $(n+2) \times 2n$ matrix U is called a Neumann-Zagier matrix if it satisfies

$$UJ_{2n}U^t = 2 \begin{pmatrix} J_2 & 0\\ 0 & 0 \end{pmatrix}$$

Thm (Neumann-Zagier 85) The exponents of the gluing and completeness euqation satisfy the above condition.

Starting with any NZ matrix U, we can form "gluing" and "completeness" equations to obtain an A-polynomial. We can compute its Mahler measure using this method.

Neumann-Zagier matrices

Let
$$J_{2k} = \begin{pmatrix} 0 & \mathrm{Id}_k \\ -\mathrm{Id}_k & 0 \end{pmatrix}$$
 be the symplectic matrix.
