

so equation of tangent line is $y-1 = 2(x-1)$ $y = 1+2(x-1)$

(20)

Example find the tangent line to $y = \frac{1}{x}$ at $x=4$

$$\text{slope } f'(4) = \lim_{h \rightarrow 0} \frac{f(4+h) - f(4)}{h} = \lim_{h \rightarrow 0} \frac{\frac{1}{4+h} - \frac{1}{4}}{h}$$

$$= \lim_{h \rightarrow 0} \frac{1}{h} \left(\frac{1}{4+h} - \frac{1}{4} \right) = \lim_{h \rightarrow 0} \frac{4 - (4+h)}{h(4+h)4} = \lim_{h \rightarrow 0} \frac{-h}{h(4+h)4}$$

$$= \lim_{h \rightarrow 0} \frac{-1}{4(4+h)} = -\frac{1}{16} \quad \text{tangent line: } y - \frac{1}{4} = -\frac{1}{16}(x-4)$$

Example: find slope of tangent line to $f(x) = mx+b$ at $x=a$:

$$f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} = \lim_{h \rightarrow 0} \frac{m(a+h)+b - (ma+b)}{h} = \lim_{h \rightarrow 0} \frac{mh}{h}$$

$$= \lim_{h \rightarrow 0} m = m. \quad \text{observation: if } f(x) = b \text{ (constant)}$$

then $f'(x) = 0$ for all x

§3.2 Derivative as a function

at each point x , there is a tangent line, with a slope, which is a number. Therefore we can define a function $\mathbb{R} \rightarrow \mathbb{R}$

notation: we call this function $f'(x)$ "the derivative of f " $x \mapsto \text{slope of tangent line at } (x, f(x))$

Example  if $f(x) = x^2$, then $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

$$= \lim_{h \rightarrow 0} \frac{(x+h)^2 - x^2}{h} = \lim_{h \rightarrow 0} \frac{x^2 + 2xh + h^2 - x^2}{h} = \lim_{h \rightarrow 0} \frac{2xh + h^2}{h} = \lim_{h \rightarrow 0} 2x + h$$

$$= 2x. \quad \text{Summary: if } f(x) = x^2 \text{ then } f'(x) = 2x$$

Example $f(x) = \frac{1}{x}$

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0} \frac{\frac{1}{x+h} - \frac{1}{x}}{h} = \lim_{h \rightarrow 0} \frac{x - (x+h)}{h(x+h)x}$$

$$= \lim_{h \rightarrow 0} \frac{-h}{h(x+h)x} = \lim_{h \rightarrow 0} \frac{-1}{(x+h)x} = -\frac{1}{x^2}$$

Remarks ① functions $f: \text{domain} \rightarrow \text{range}$ e.g. $f: \mathbb{R} \rightarrow \mathbb{R}$

(2)

derivative : (differentiable) $\rightarrow$ functions
functions

$$f \longmapsto f'$$

warning: not all functions differentiable.

② "calculus" means rules for doing calculations. We want have to explicitly compute limits all the time.

Example $f(x) = x^3$ $f'(x) = \lim_{h \rightarrow 0} \frac{(x+h)^3 - x^3}{h} = \lim_{h \rightarrow 0} \frac{x^3 + 3x^2h + 3xh^2 + h^3 - x^3}{h}$
 $= \lim_{h \rightarrow 0} 3x^2 + 3xh + 3h^2 = 3x^2$ Q: what about x^{100} ?

Thm (powers of x) If $f(x) = x^n$ then $f'(x) = nx^{n-1}$ (works for all $n \in \mathbb{R}$!)

Examples $\frac{d}{dx}(x^2) = 2x$ $\frac{d}{dx}(x^3) = 3x^2$ $\frac{d}{dx}(x) = 1$ $\frac{d}{dx}(1) = 0$

$$\frac{d}{dx}\left(\frac{1}{x}\right) = \frac{d}{dx}(x^{-1}) = -x^{-2} = -\frac{1}{x^2} \quad \frac{d}{dx}(\sqrt{x}) = \frac{d}{dx}(x^{1/2}) = \frac{1}{2}x^{-1/2} = \frac{1}{2\sqrt{x}}$$

Thm $\frac{d}{dx}(x^n) = nx^{n-1}$

Proof $f(x) = x^n$ $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0} \frac{(x+h)^n - x^n}{h}$

Fact: binomial theorem: $(x+h)^n = x^n + nx^{n-1}h + \binom{n}{2}x^{n-2}h^2 + \dots + \binom{n}{n-1}xh^{n-1} + h^n$

$$\binom{n}{k} = \frac{n!}{k!(n-k)!} \quad \text{so} \quad \lim_{h \rightarrow 0} \frac{(x+h)^n - x^n}{h} = \lim_{h \rightarrow 0} \frac{x^n + nx^{n-1}h + h^2(-) - x^n}{h}$$

$$= \lim_{h \rightarrow 0} nx^{n-1} + h(-) = nx^{n-1} \quad \square$$

Warning: this rule only works for polynomials, not exponentials

$$f(x) = x^{100} \quad f'(x) = 100x^{99}$$

$$f(x) = 2^x \quad \text{not polynomial.}$$

Other useful rules Thm (linearity) If f and g are differentiable

functions, then: $f+g$ is differentiable, with $(f+g)' = f' + g'$

$$\Leftrightarrow \frac{d}{dx}(f+g) = \frac{df}{dx} + \frac{dg}{dx}$$

• k constant: $(kf)' = kf' \Leftrightarrow \frac{d}{dx}(kf) = k \frac{df}{dx}$

Proof (follows from limit laws)

$$\begin{aligned} \bullet (f+g)'(x) &= \lim_{h \rightarrow 0} \frac{(f+g)(x+h) - (f+g)(x)}{h} = \lim_{h \rightarrow 0} \frac{f(x+h) + g(x+h) - f(x) - g(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} + \lim_{h \rightarrow 0} \frac{g(x+h) - g(x)}{h} = f'(x) + g'(x) \end{aligned}$$

$$\begin{aligned} \bullet (kf)'(x) &= \lim_{h \rightarrow 0} \frac{(kf)(x+h) - (kf)(x)}{h} = \lim_{h \rightarrow 0} \frac{kf(x+h) - kf(x)}{h} \\ &= \lim_{h \rightarrow 0} k \frac{f(x+h) - f(x)}{h} = k \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = kf'(x) \quad \square \end{aligned}$$

Example $f(x) = x^2 - 3x + 2$. Find $f'(x)$

$$\frac{df}{dx} = \frac{d}{dx}(x^2 - 3x + 2) = \frac{d}{dx}(x^2) - 3 \frac{d}{dx}(x) + \frac{d}{dx}(2) = 2x - 3 + 0 = 2x - 3.$$

graphs:

Derivative of e^x consider $f(x) = b^x$ ($b > 0$)

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0} \frac{b^{x+h} - b^x}{h} = \lim_{h \rightarrow 0} b^x \frac{b^h - 1}{h}$$

$$= b^x \lim_{h \rightarrow 0} \frac{b^h - 1}{h}$$

→ this limit does not depend on x !

Assume this limit exists and call it m_b

We have shown: for exponential functions, the derivative is

proportional to the original function, i.e. if $f(x) = b^x$ then

$$f'(x) = m_b b^x. \quad \text{in particular, the slope at } x=0 \text{ is } m_b.$$
